

**VISUAL CONTRACT FIXTURE — NOT A
STAKEHOLDER BRIEF**

Verify vendor-neutral and selected-profile rendering under real browser conditions.

This shell is intentionally incomplete. It is not a stakeholder decision package and must not be reported as rendered or delivered.

Next safe step

Complete the canonical artifacts, record source coverage and obtain distinct review before rendering.

Value & scope

Architecture

Impact

Execution

Validation

Evolution

Decision

Coverage

OUTCOME

Beneficiary and observable result.

VALUE

Benefit or risk reduction.

PROPORTIONALITY

Why this depth fits.

AUTHORITY

Draft/ready/evidence state.

Value and scope

Mission: establish why this initiative exists and the decision boundary before delivery detail. Render the source-backed value pillars, material high-level technical or operating pillars, outcome level,

limits, main risk and current authority—not a generic checklist.

In scope

Deliberately out

► **Outcomes, limits and edge cases**

Architecture

Mission: orient the reader to the source-backed structure and boundaries that make the outcome safe. **Vision:** show only the responsibilities, trust/information boundaries, contracts, flow, failure or rollback that materially shape a decision.

Replace with source-backed components, operating controls, contracts, data/trust, failure and rollback; for a simple/localized initiative state a concise justified N/A instead of inventing a diagram.

► **Decisions and trade-offs**

Impact

Mission: make the change footprint and its controls decision-ready. **Vision:** show affected people, work areas, interfaces, information, compatibility, risks, owners and contingencies when the source makes them material; “surface” is an affected area, not a command shell or programming layer.

► Risk and unknowns

Execution — draft is not authorization

Mission: show how each material task creates a safe, observable increment. For each source task, project its non-empty objective/outcome/increment, scope/anti-scope, contracts, dependency, risk/assurance, validation/evidence, exit, status/authority and why-now—not only a title.

Task draft → coverage review → meeting → source propagation → Tasks Ready

► Task ledger and cards

Validation

Mission: make the proof path and its limits recoverable. Map acceptance/risk to method, command or manual context, fixture/data when relevant, oracle, evidence destination, owner and honest limitation/skip rationale.

► **Commands and limits**

Evolution and state

Mission: explain what changed, why, what remains open and what gate is truthful now. Render material decisions, supersession, freshness, checkpoint, risks and authority rather than inferring state from prose.

► **Gates**

Decision and next step

Mission: make owner, consequence, authorization boundary and one exact next action unambiguous. The HTML displays canonical authority; it never grants approval itself.

Append meeting decision and propagate sources before refresh.

Coverage and provenance

Mission: show why a reader can trust the projection: the human register complements local provenance and identifies represented, synthesized and justified absent material without a JSON index.

SOURCE / HEADING	TARGET ID	DISPOSITION / RATIONALE
Canonical source / heading group	Stable rendered target	Synthesized, represented, justified N/A or documented link-only.

Derived meeting projection: correct canonical sources, not HTML alone.
